

Q 5 Ans

The output is an error message c# does not support multi-class inheritance.
ConsumerRequest cannot inherit from both Bank and Loan.

To fix this,
Interface feature of c# is required .

Method bankInfoPrint() should be a member of an interface under class that is based on that interface.

Method LoanInfoPrint() should be a member of an interface under class Loan that is based on that interface.

After case 1 in main function there is need for 'break;' to enable looping to the next case.

Possible solution to code and illustration of above view is attached in file q5_code_solution.cs
